

Dear Participants for 'Targeted proteomics with Skyline' in May Institute,

- Bring a laptop that has a Windows OS. If the participants bring a Mac, they should make sure it either has dual boot for Windows or has a Windows VM with Skyline-daily running (e. g. VMWare).
- We will provide necessary data on a flash drive. Each participant will get their own flash drive, however in the interest of time, it will be important to pre-install as much as possible. In particular:
  1. Install the most recent version of Skyline-daily (3.6.1.10690 or later) from <http://skyline.maccosslab.org> (click the green "Skyline-daily (beta)" button)
  2. Install the following Skyline tools from the "Tool Store" in Skyline under "Tools" (internet access required):
    - a. MSstats
    - b. QuaSAR
  3. Install "AutoQC-daily" from the following link:  
<http://skyline.gs.washington.edu/software/AutoQC/daily/index.html>

See you next week.

Sincerely,
